

## WHITE LABELING

The replacement interface is designed to allow changing colors, logos and many other aspects of the interface to custom fit the needs. South Seas Data has recognized that customers may need a fully customized experience based on the endpoint purpose. With that in mind, the interface can be fully modified to fit the exact theming of the device.

## POS SOLUTIONS

We offer adjuncts to your solution. Supporting legacy systems? New installs are great, but it's also great to build long term support for your existing installs. We can save your data, help your business grow, and save your time because time is money.

## LONG TERM SUPPORT

We can save you time and money on development and support by replacing the user experience for Windows or Linux with a unified, custom tailored and welcoming experience. This includes additional customization after deployment, TMS (Terminal Management System) integration, theming changes, as well as any troubleshooting or additional deployment configuration.

Implementation  
Security  
Control  
White labeling  
Long Term Support  
Simple Licensing schedule

We design, customize, and manage our client's endpoint allowing them to focus on growing their business.

## SYSTEM INTERFACE REPLACEMENT (SIR):

At South Seas Data, we have built SIR to replace the user's experience and turn it into a locked down, secure and user friendly experience. Some of the key advantages are:

- Launch your business applications from the desktop with a click or a touch.
- Advanced configuration lets your customers and helpdesk make changes easily without risks or compromises to security.
- Multilingual support for your customers, native language can be changed at any time.

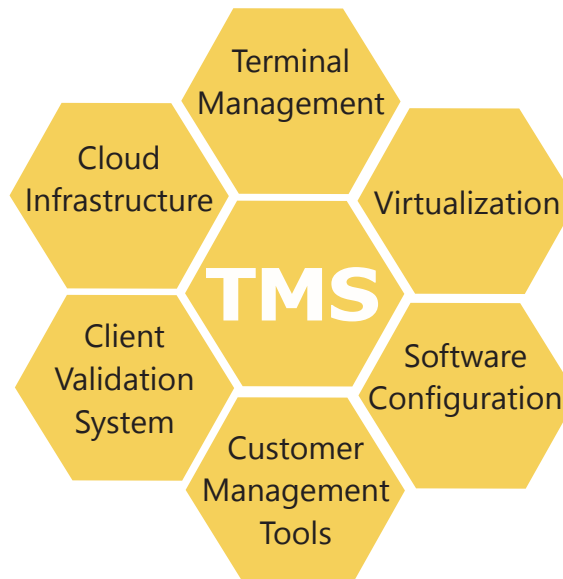

We utilize the SIR system to align the overall experience with your goals and user's needs and let you make well-informed decisions.

## TERMINAL MANAGEMENT SYSTEM (TMS)

South Seas Data can help your business manage Saltstack (TMS). Our team can manage any software, cloud infrastructure, or virtualization your business needs.

Saltstack can be used to manage thousands of terminals and quickly configured to target machines. We can support you in running Saltstack in Windows or Linux.

## SECURITY AND CONTROL

Prevent fraud and other sources of lost revenue by ensuring that malicious users do not have the ability to place malware on your system. By removing the standard Windows 10 interfaces the total exposure surface is limited, removing many avenues for exploits by unknown sources. The South Seas Data interface replacement software allows you to put your user on rails and make their experience exactly what you want without room for error.

## PCI COMPLIANCE

PCI compliance requires encryption. You must encrypt data that is sent from a local point of sale (POS) device to a card processor, and between the pin pad and the POS device. We can help you achieve PCI compliance with our SIR endpoint software, assist you with the platform setup and with any issue in advance.
